IMPRESS 2017

Annual Review Report - 2016-17

SAVE TREE

The focuses on the urgent need to save trees. Trees are our truest friends. These green friends provide us with clean air, fruits, vegetables, wood, and many other things necessary in our lives. That means our survival is only possible if we save trees.

But with time, the human race has done enough damage and made the situation quite worse. As a result, all the countries have come together to save trees so that we can preserve the planet Earth. Do you know what would happen if there were no trees? Why is it so necessary to save trees and how can we do that?

These are some of the most important questions that must be answered in order to realize the value of this issue and save trees. Let's look at them one by one.

Importance of Trees:

Human beings breathe in oxygen and breathe out carbon dioxide, releasing it into the atmosphere. The biggest reason why we must save trees is that they provide us with oxygen without which we would die. And not only that, but they also reduce the toxic carbon dioxide by consuming it in the process of photosynthesis, another great reason for us to save trees.

Trees are also the source of food for both humans and herbivorous animals. They form an essential segment in the food chain. If we do not save trees, the whole chain would collapse. Forests also act as the living territories of wild animals.

Roots of the trees hold the soil and

prevent it from loosening. In this way, they reduce the chances of floods. When we save trees, it also maintains the water cycle in the atmosphere. To restore the groundwater and raise its level, the only way out is to save trees.

Trees absorb the pollutants from the air and make it clean. Their shade saves us from the scorching sunlight and pleases us with cool air. They play an indispensable role for birds, honey bees, butterflies, and plenty of other living beings that are essential for the ecological balance.

In short, there are countless causes to save trees. On a serious note, in

an effort to save trees, we are also helping the earth keep a cooler temperature. Trees and their oxygen act as a shield from the heat and ultraviolet rays of the sun.

Deforestation and Its Causes:

For an ample number of reasons, humankind has failed to save trees. Deforestation is the main culprit behind it with many other factors lying in its base. For instance, more land is needed for the consistently growing population. To construct the living areas and houses for everyone, we are bound to cut trees when in reality, we should save trees.

Big industries are sweeping off an enormous number of forests and setting up their factories. Chopping off the trees for paper and timber is yet another cause of deforestation. As explained above, to feed millions of people, natural forests are being replaced with agricultural farms and fields.

Because we did not save trees in the first place, an increased frequency of floods leads to even more destruction of forests. The massive trend of mining for minerals, ores, and precious metals has also turned the situation against us.

Natural calamities such as forest fires, earthquakes, and cyclones, wash away the human efforts to save trees. These powerful events can be managed only up to a certain level and yet result in the desertion of forests for a long time.

Now that we have discussed the major causes of the decreasing number of trees, below are some of the significant side effects of deforestation and ways to deal with it.

Impacts of Deforestation:

Due to our mismanagement to save trees, the impacts of deforestation are spreading widely all over the world. First of all, the greatest effect can be seen in the form of global warming. The temperature of the earth is rising consistently. Consequently, the icebergs at the poles are melting and increasing the sea levels.

When we are unable to save trees, the disaster also comes in the form of floods. Poor forest areas mean there are no trees to hold the soil. Loose soil particles cannot act as a strong barrier and fail to prevent the floods.

Deforestation is responsible for growing air pollution. Without trees, the levels of carbon dioxide rise in the atmosphere. The percentage of oxygen becomes terrible. If we don't save trees, we are also ruining the lives of wild animals. Without forests, they have no place to live safely and become more vulnerable to hunting, capturing, and extinction.

As the most intelligent species on earth, it is the duty of mankind to save trees because once the wild animals like carnivores are threatened, the danger reaches to herbivorous animals too. Gradually, the effect would spread to human be-

ings and the whole food pyramid would fall down eventually.

Necessary Measures:

We need to save trees and help them flourish. When we save trees, we ensure our own survival on the planet. To save trees, the first step should be planting as many trees as possible. Celebrating Environment day is one of the many effective measures to save trees.

Creating awareness among the general public with the help of 'save trees' campaigns would be helpful too. In schools, children should be given the opportunity to draw pictures on the topic of 'save trees'. They may also be asked to write short articles on 'save trees' and share it with others.

As far as possible, wastage of paper should be avoided. Population control and curbing the industrialization are the biggest ways to save trees. By reducing the harmful activities such as mining and cutting trees, we would face lesser floods, earthquakes, and cyclones.

The bottom line is that for our planet to be greener and healthier, we must promise ourselves to save trees, for this generation and for the future generations to come. Thus, we can all save trees by making changes in our lifestyle.
